

Is EPA's Stage II's disinfection byproduct rule a concern?

Now, it is possible to know exactly what your system's TTHM level is at all times. Multisensor makes the world's only real-time reagent-less THM monitor. Applications include plant optimization, distribution system TTHM level monitoring at a distant point in the system, and water system interconnects to ensure acceptable TTHM levels for municipalities. Multisensor's THM monitor has no reagents, and, in fact, no contact with the water itself, which translates to extremely low overall maintenance.
